

Mortality Panel-shared learning

Antibiotics

- Give ASAP and within 1 hour of birth/sepsis suspected
- Can give via central line before xray
- May be appropriate for medical staff to administer via newly inserted central line prior to fixation/imaging

HIE

- Ensure early neurological examination performed (may alter management eg need for early imaging if suspected intracranial haemorrhage)
- Early referral for therapeutic hypothermia (need to achieve target temperature by 6 hours, the earlier the better)

Equipment fixation

- Securing of tubes/lines- as secure as possible
- Dislodging may lead to life threatening complications
